

DAY 08 / X01 • A17 LUNAR EXPLORER

A digital design.

A physical boundary.

A17 Lunar Explorer is a complete digital engineering package for its released scope.

The rocket has not been fabricated, physically validated, or flown.

What is inside

Design

CAD and printable files, drawings, renders, and original graphics

Build reference

Documentation, inspection and safety guidance, and a bill of materials

Models

OpenRocket artifacts and modeled trajectory outputs

Traceability

Public claims, rights, and provenance records

The assembly exists as files

The CAD and simulation can be inspected before a physical article exists.

Modeled

A predicted result from the digital design

Measured

A real-world result that this release does not provide

What is not claimed

Fabrication	Not performed
--------------------	----------------------

Ground testing	No physical validation established
-----------------------	---

Flight	Not performed
---------------	----------------------

Performance	No measured or guaranteed result
--------------------	---

No NASA affiliation, sponsorship, approval, endorsement, official status, or official-replica status.

Ask the evidence the right question

The files show what was designed.

They can be inspected for geometry, part relationships, modeled results, and documented assumptions.

Physical evidence shows what happened.

Fabrication quality, measured dimensions, ground tests, and flight behavior require separate work and separate proof.

This release keeps those states distinct.

Explore the package

Start with the scope and safety boundary. Then inspect the engineering download and its provenance records.

A digital release is not authorization to build or launch. Check current rules and qualified supervision before physical use.
